Preparation (/support/documentation/index.php/universal/2-preparation)

Installing

Software

In order to start developing, you need to have installed the JDK (http://www.oracle.com/technetwork/java/javase/downloads/index.html), make sure to install all components.

You also need to download Android Studio (http://developer.android.com/sdk/index.html) which will also install the SDK manager.

SDK manager

The installer, as also shown in the video, should automatically download all required components.

If you do a manual setup, download at least the following components using the SDK manager:

In the tools folder:

- SDK Tools
- SDK Platform Tools
- SDK Build Tools

In the extras folder;

- Google Play Services
- Android Support Library
- Android Support Repository
- Google Repository
- Google USB Driver

And at least one SDK version (At least Android V23 Marshmallow).

After you're done, you can open Android Studio and continue.
